Figure S1. Peripheral blood mononuclear cells (PBMC) expression levels of CD80 and CD86 after phytohemagglutinin (PHA) stimulation. PBMCs were stimulated with 2.5 μg/mL PHA for 24 h, after which cells were stained with FITC-labeled monoclonal antibody against CD80 and PE-labeled monoclonal antibody against CD86, using FITC-labeled monoclonal antibody against IgG2b and PE-labeled monoclonal antibody against IgG2a as isotype controls. Cells were analyzed by flow cytometry for expression of CD80 and CD86. Data are the representative FACS profiles and percentages of positive cells.
